

Data Center Infrastructure Innovation

Velocity 2010

James Hamilton, 2010.06.23
VP & Distinguished Engineer

e: James@amazon.com

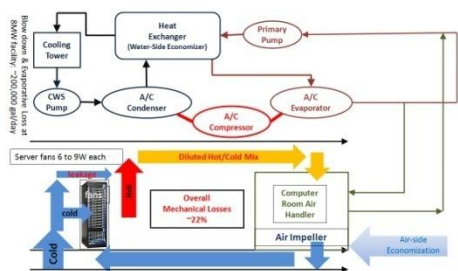

w: mvdirona.com/jrh/work

b: perspectives.mvdirona.com

Outline

- Quickening Pace of Datacenter Infrastructure Innovation
- Where does the money go?
- Power Distribution Infrastructure
- Mechanical Systems
- Sea Change in Net Gear
- Server Innovations

Talk does not necessarily represent positions of current or past employers

2010/6/23

Pace of Innovation

- Datacenter pace of innovation increasing
 - Driven by cloud service providers and very high scale internet applications like search
 - Cost of datacenter & H/W infrastructure dominates
 - Not just a cost center
- High focus on infrastructure innovation
 - Driving down cost
 - Increasing aggregate reliability
 - Reducing resource consumption footprint

Where Does the Money Go?

- **Assumptions:**

- Facility: ~\$88M for 8MW critical power
- Servers: 46,000 @ \$1.45k each
- Server power draw at 30% load: 80%
- Commercial Power: ~\$0.07/kWhr
- Power Usage Effectiveness: 1.5

Monthly Costs

3yr server, 4yr net gear, & 10 yr infrastructure amortization

- **Observations:**

- 34% costs functionally related to power (trending up while server costs down)
- Networking high at 8% of costs & 19% of total server cost (many pay more)

Updated from: <http://perspectives.mvdirona.com/2008/11/28/CostOfPowerInLargeScaleDataCenters.aspx>

Power Distribution

High Voltage
Utility Distribution

115kv

Sub-station

0.3% loss
99.7% efficient

Generators

13.2kv

UPS:
Rotary or Battery

6% loss
94% efficient, ~97% available

11% lost in distribution

$$.997 * .94 * .98 * .98 * .99 = 89\%$$

IT Load (servers, storage, Net, ...)

UPS & Gen
often on 480v

~1% loss in switch
gear & conductors

208V

Transformers

2% loss
98% efficient

Transformers

2% loss
98% efficient

13.2kv

13.2kv

480V

Power Distribution Efficiency Summary

- Note: 2 more power conversions after last slide

- 5. Power Supply: often <80% at typical load

- 6. On board voltage regulators (VRMs or VRDs)

- <80 Common & ~95% efficient available

- Rules to minimize power distribution losses:

- Oversell power (more potential load than provisioned power)

- Avoid conversions (fewer transformer steps & more efficient UPS)

- Increase efficiency of conversions

- High voltage as close to load as possible

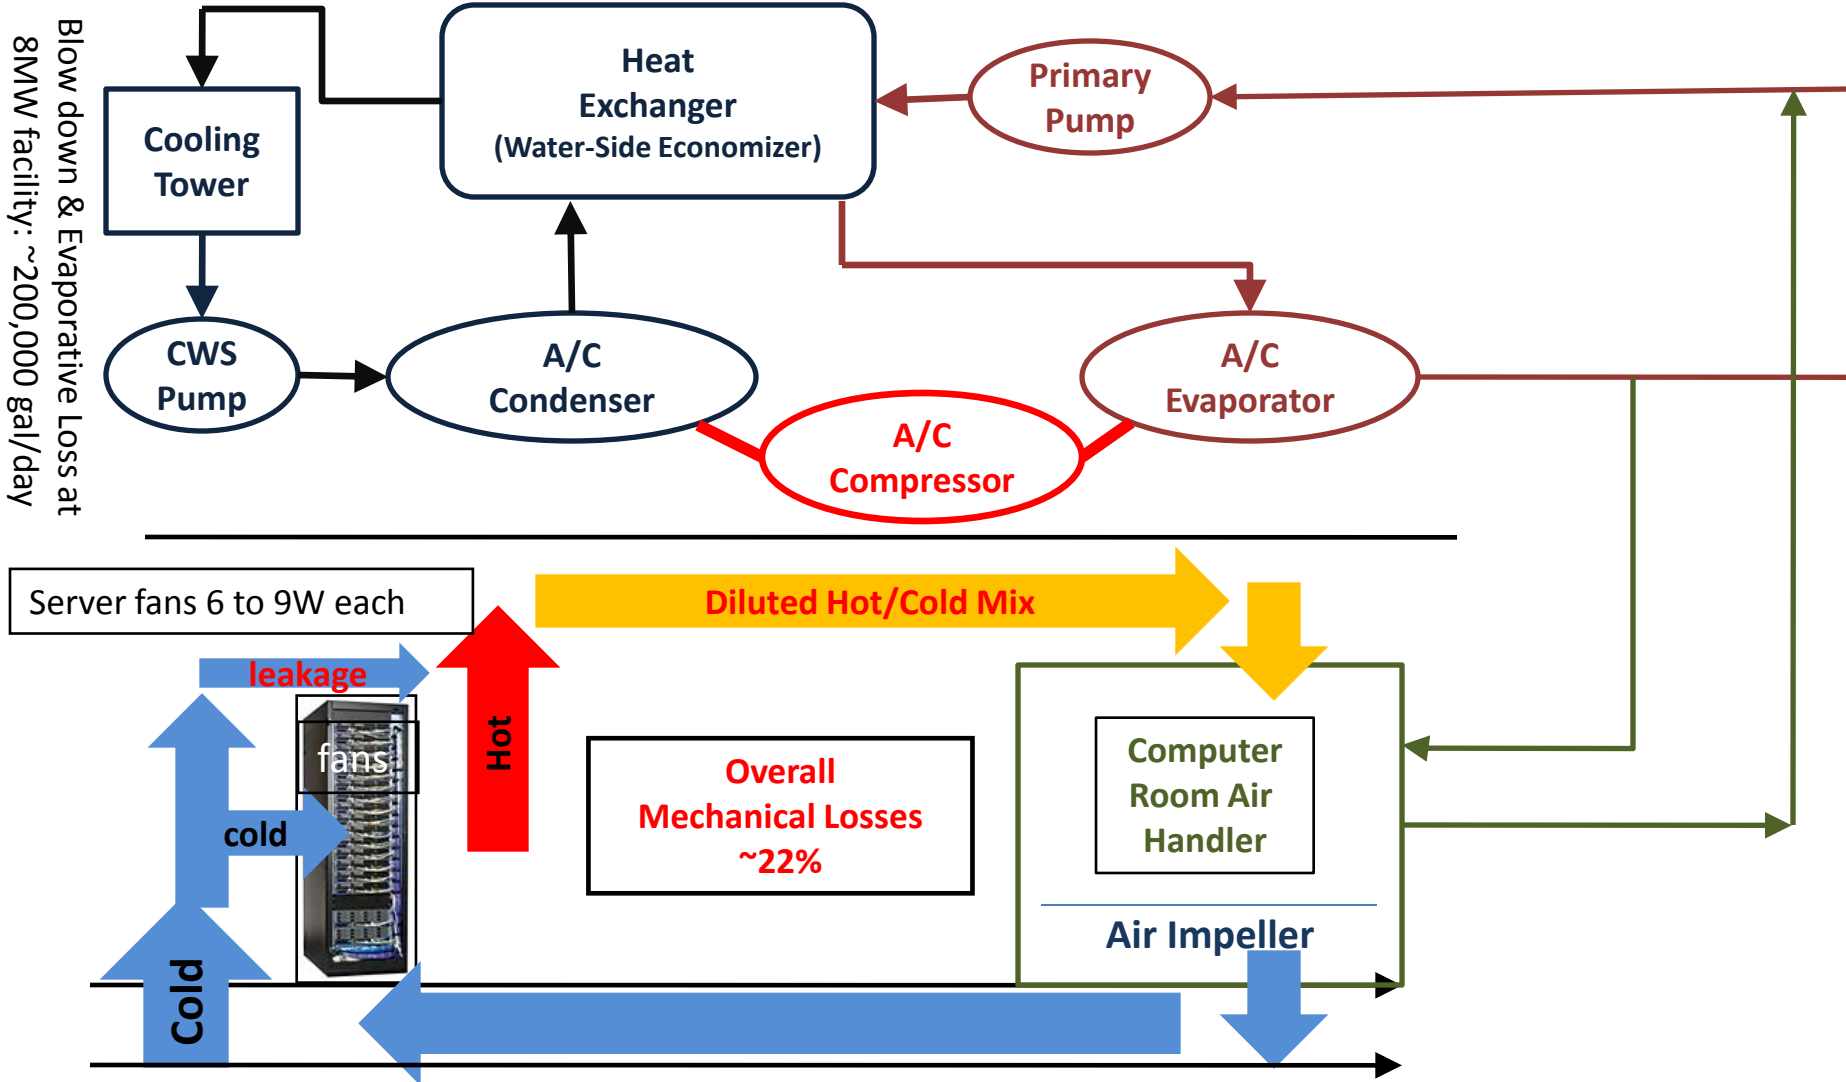

- Size voltage regulators to load & use efficient parts

- High voltage direct current a small potential gain

- **But power distribution improvements bounded to 11%**

Mechanical Systems

Hot Aisle/Cold Aisle Containment

Intel

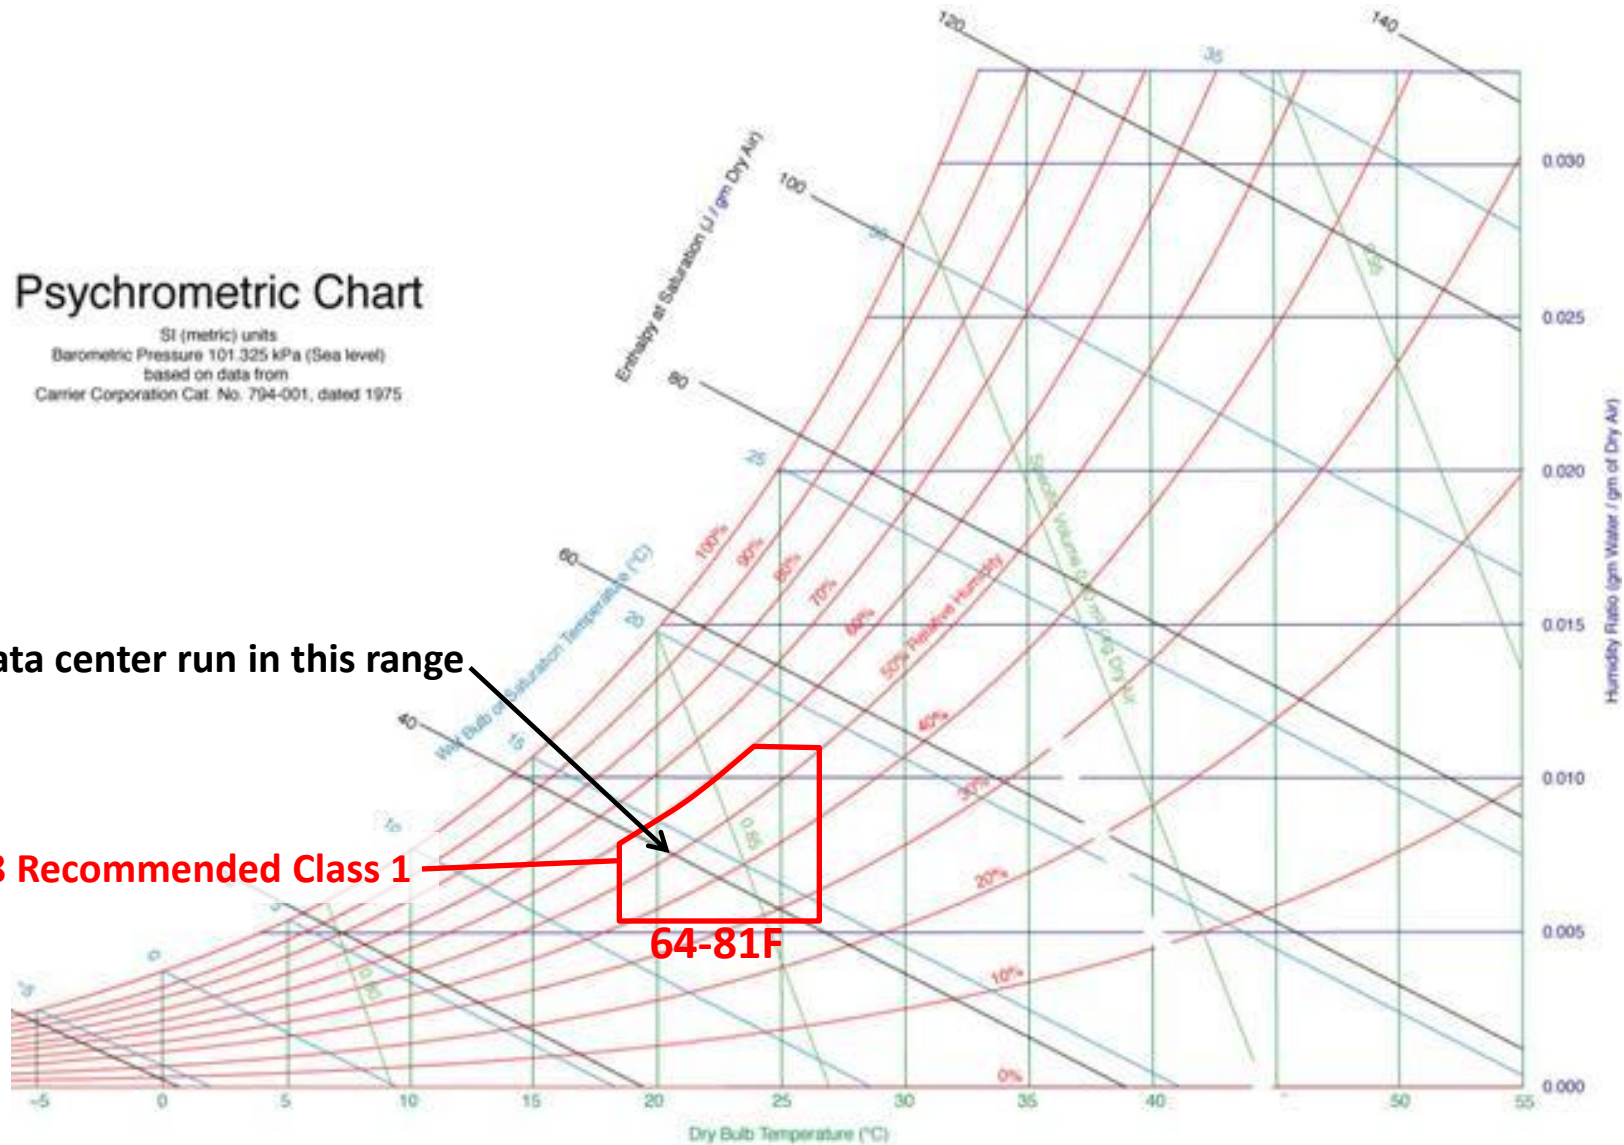

Intel

ASHRAE 2008 Recommended

Psychrometric Chart

SI (metric) units
Barometric Pressure 101.325 kPa (Sea level)
based on data from
Carrier Corporation Cat. No. 794-001, dated 1975

Most data center run in this range

ASHRAE 2008 Recommended Class 1

64-81F

ASHRAE Allowable

NEBS (Telco) & Rackable Systems

Psychrometric Chart

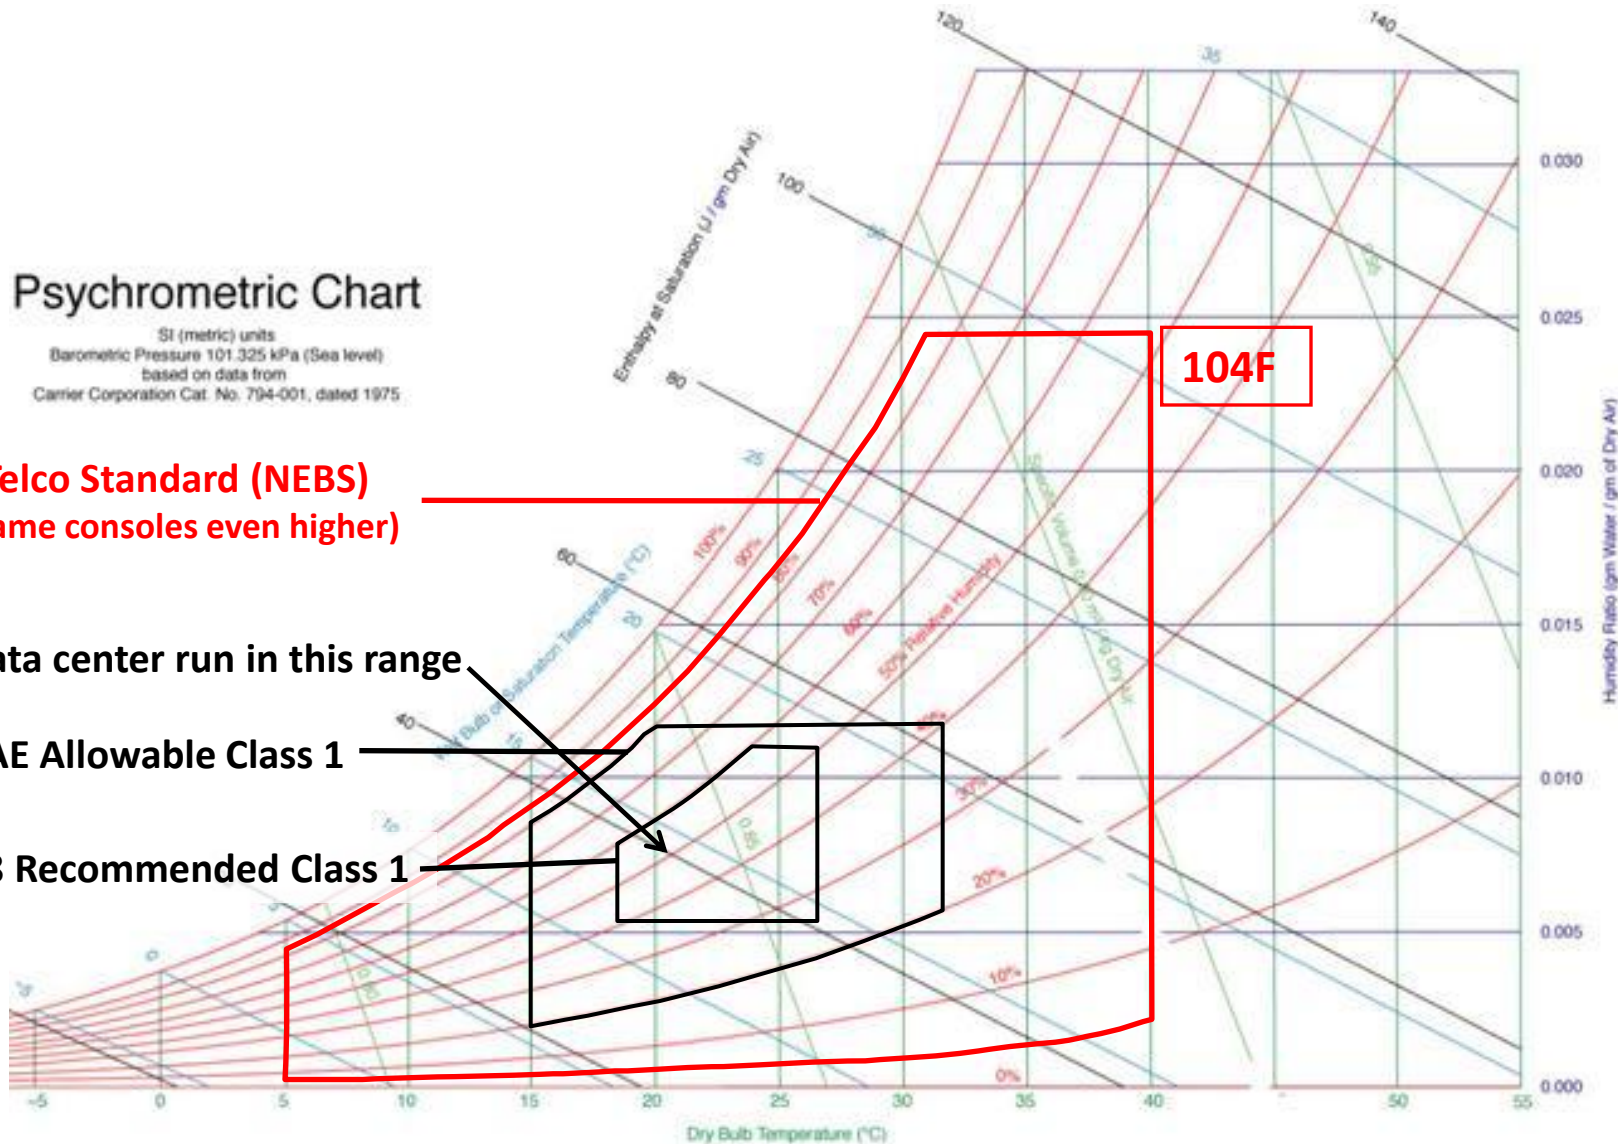

SI (metric) units
Barometric Pressure 101.325 kPa (Sea level)
based on data from
Carrier Corporation Cat. No. 794-001, dated 1975

Telco Standard (NEBS)
(game consoles even higher)

Most data center run in this range

ASHRAE Allowable Class 1

ASHRAE 2008 Recommended Class 1

Air-Side Economization & Evaporative Cooling

- Limiting factors to high temp operation
 - Higher fan power trade-off
 - More semiconductor leakage current
 - Possible negative failure rate impact
- Avoid direct expansion cooling entirely
 - Air side economization
 - Higher data center temperatures
 - Evaporative cooling
- Requires Filtration
 - Particulate & chemical pollution

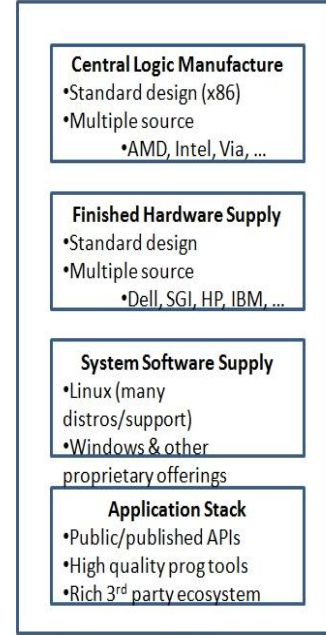

Sea Change in Net Gear

- Current networks over-subscribed
 - Forces workload placement restrictions
 - Goal: all points in datacenter equidistant
- Mainframe model goes commodity
 - Competition at each layer rather than vertical integration
- OpenFlow: open S/W platform
 - Distributed control plane to central control
 - E.g. VL2, Portland, and others

Net Equipment

Commodity Server

Server Innovation

- Shared Infrastructure Racks
 - Shared redundant PSUs & fans
 - e.g. Dell Fortuna & Rackable CloudRack
- Next Level: Multi-server on board
 - Intel Atom: SeaMicro
 - ARM: SmoothStone
- Very Low-Cost, Low-Power Servers
 - ARM, Atom, client & embedded CPUs
 - Cold storage (reduce CPU \$ to GB)
 - Highly partitionable workloads: Web services, memcached
- Low utilization is still the elephant in room
