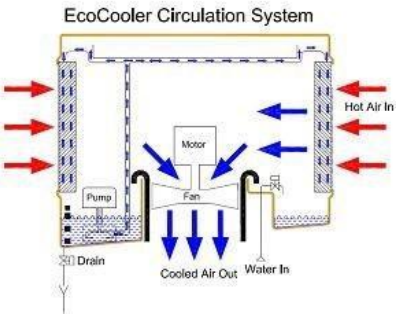
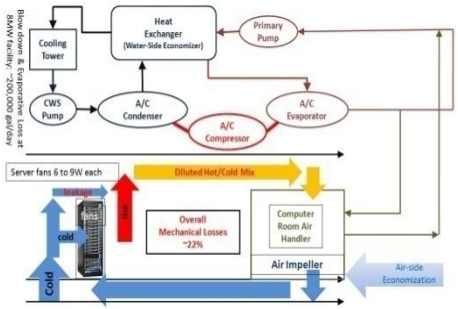
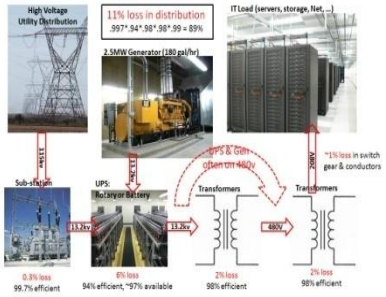
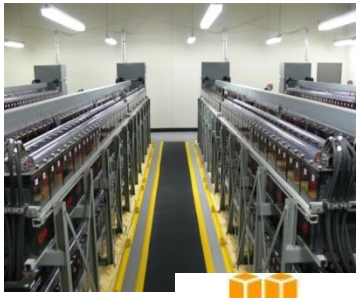
Agenda

- Cloud & Accelerating Pace of Innovation
- Technology Changes
  - Memory wall & Storage Chasm
  - Disk is Tape
  - Sea Change in Networking
- Data & Storage Trends
  - Map Reduce & NoSQL
  - Migration to Cloud









Talk does not necessarily represent positions of current or past employers

The DB World is on Fire Again

- One Size does not fit all
  - Stonebraker showed >3 DB companies actually possible
  - Customers willing to support multiple DBMS
- 30 year old architectural decisions no longer valid
  - Memories exploding
  - Disk IOPS density going backwards
    - 1990 Seagate ST41600: 37.5 IOPS/GB
    - 2007 Seagate ST373453 : 2.4 IOPS/GB
- Plunging cost of computing
- Cloud computing accelerates all above

amazon web services

Plunging Cost of Computing

- Rapidly declining cost of computing
  - Technology & cloud computing economies of scale
- Warehouse & analytical use scales inversely with cost
  - Lower costs supports more data & deeper analysis
- Traditional transactional systems scale with business
  - Purchases, ad impressions, pages served, etc.
  - Machine-to-machine transactions scale faster limited only by value of transaction & cost (e.g. computational trading)

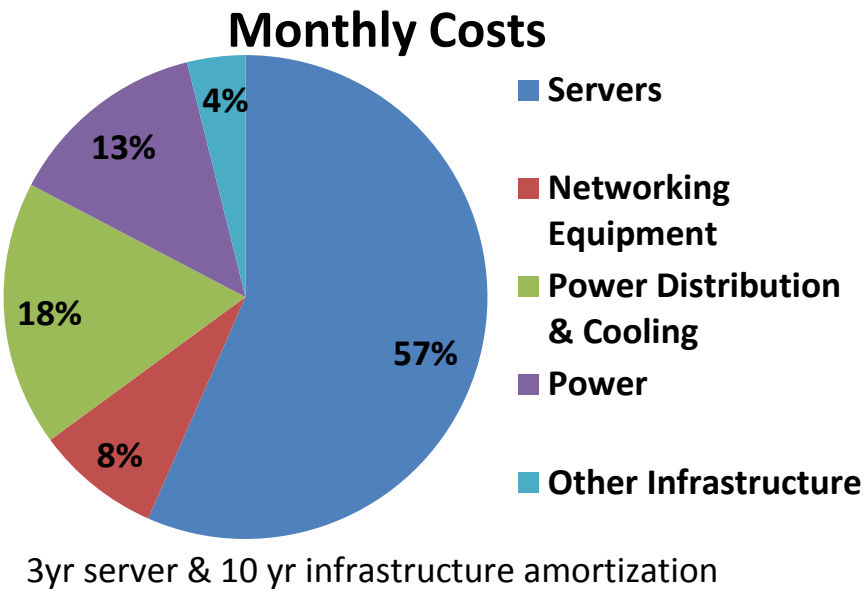
Cloud Computing Driving Wave of Innovation & Growth

- Datacenter pace of innovation increasing
  - More innovation in last 5 years than previous 15
  - Driven by cloud service providers & very high-scale internet applications like search
- Not just a cost center
  - At scale, focus on cost
  - Mechanical, power, server, & net specialists
- Server, Storage, & infrastructure costs falling fast
- Data is the challenge
  - Scaling is easy without data

Perspective on Scaling

Where Does the Money Go at Scale?

- **Assumptions:**
  - Facility: ~$88M for 8MW critical power
  - Servers: 46,000 @ $1.45k each
  - Commercial Power: ~$0.07/kWhr
  - Power Usage Effectiveness: 1.45



3yr server & 10 yr infrastructure amortization

- **Observations:**
  - 31% costs functionally related to power (trending up while server costs down)
  - Networking high at 8% of overall costs & 19% of total server cost (many pay more)

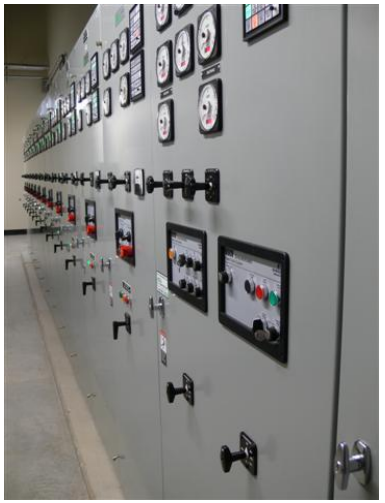
Limits to Computation



- Processor cycles are cheap and getting cheaper
- What limits application of infinite cores?
  1. **Data**: inability to get data to processor when needed
  2. **Power**: cost rising and will dominate
- Most sub-Moore attributes need most innovation
  - Infinite processors require infinite power
  - Getting data to processors in time to use next cycle:
    - Caches, multi-threading, ILP,…
    - All techniques consume power
    - All off chip techniques consume a lot of power
- Power & data movement key constraints
  - Requires more complex programming model with different optimization points

amazon web services

Storage & Memory B/W lagging CPU

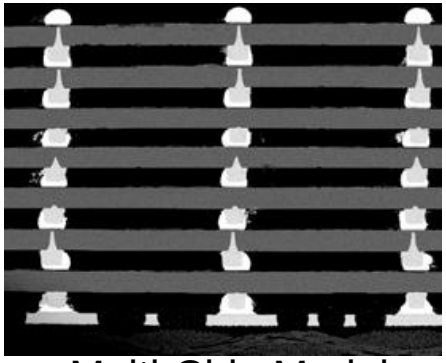
	CPU	DRAM	LAN	Disk
Annual bandwidth improvement (all milestones)	1.5	1.27	1.39	1.28
Annual latency Improvement (all milestones)	1.17	1.07	1.12	1.11

- CPU B/W requirements out-pacing memory and storage
- Disk & memory getting "further" away from CPU
  - Core limiting factor: power consumption & data availability
  - Powered CPU cores have no value without data
- Large sequential transfers better for both memory & disk

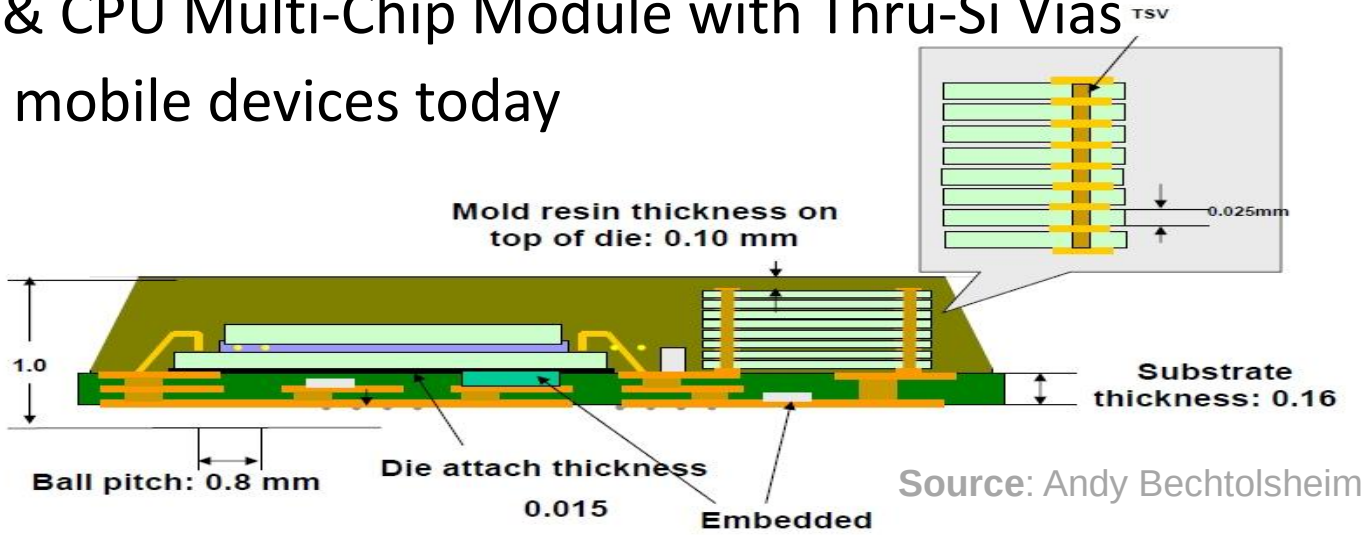
Source: Dave Patterson: Why Latency Lags Bandwidth and What It Means to Computing

Memory Wall

- Adding processor I/O pins has a positive impact but at significant power cost
  - Positive but bounded impact
- Taming the memory wall:
  - Mem & CPU Multi-Chip Module with Thru-Si Vias
  - Lab & mobile devices today



Multi-Chip Module

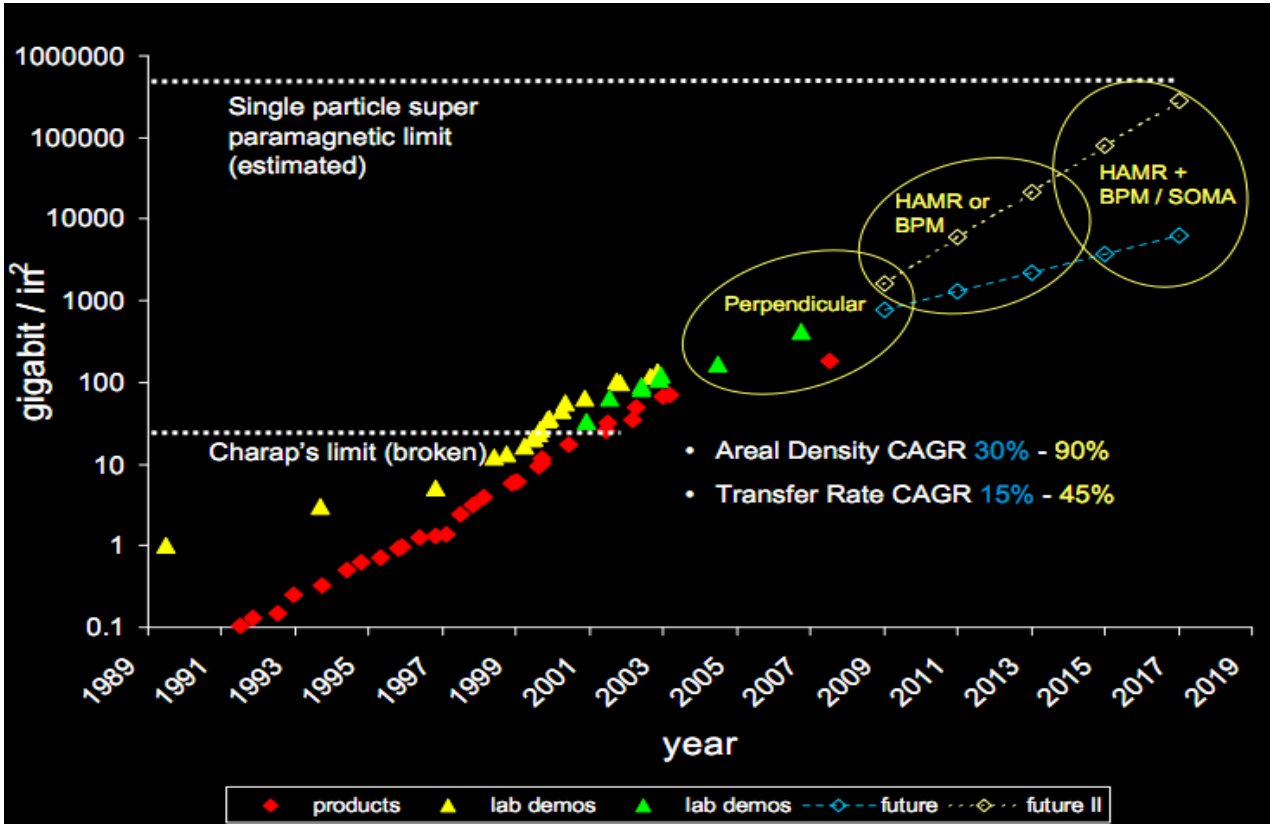


Source: Andy Bechtolsheim

- But what about HDD & storage chasm?

HDD: Capacity

- Capacity growth continues unabated

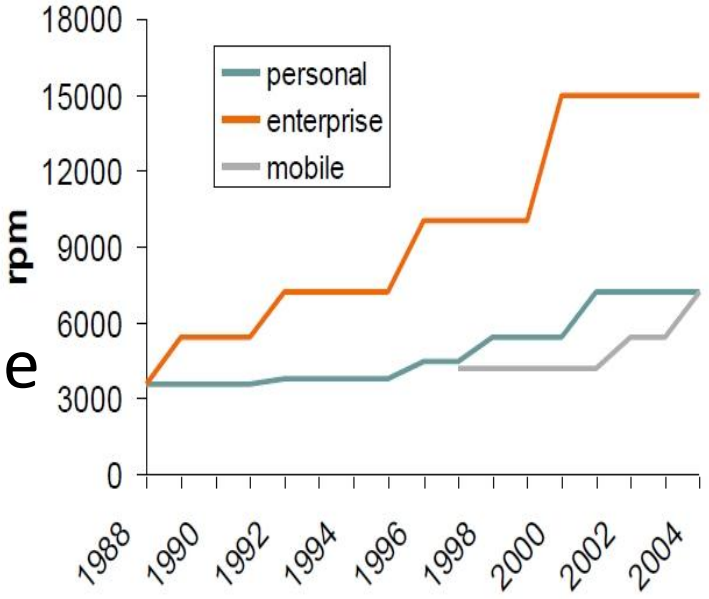


- Capacity isn't the problem
  - What about bandwidth and IOPS?

Source: Dave Anderson

HDD: Rotational Speed

- RPM contributes negatively to:
  - rotational vibration
  - Non-Repeating Run Out (NRRO)
  - Power cubically related to RPM
- >15k RPM not economically viable
  - no improvement in sight
- RPM not improving & seek times only improving very slowly
- IOPS improvements looking forward remain slow



product information for Seagate and Control Data disc drives since 1988, mobile includes Toshiba drives since 1997

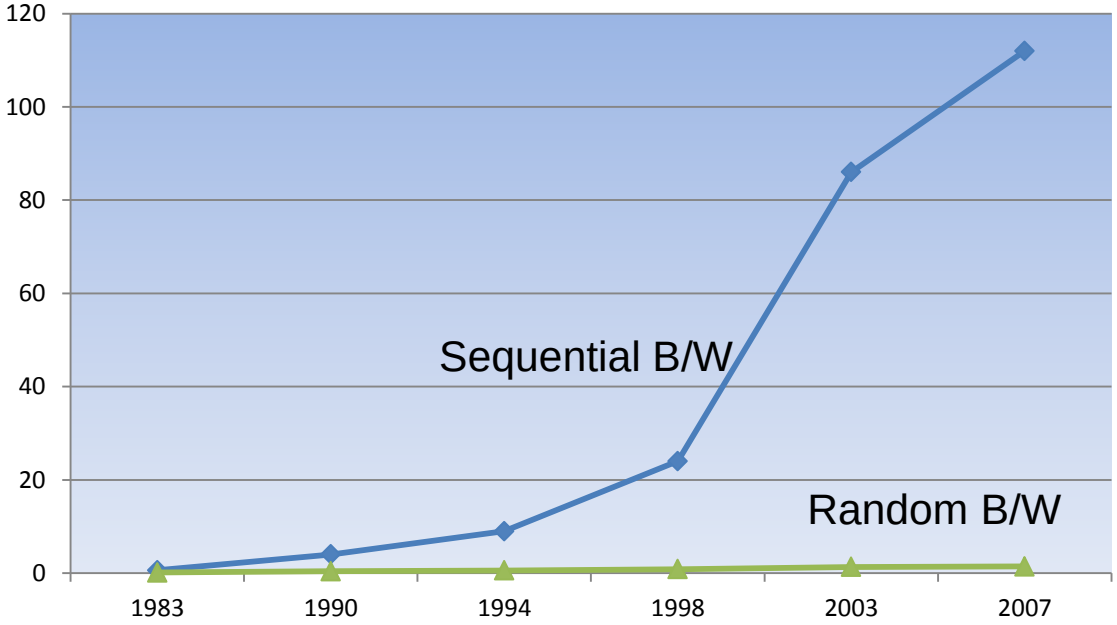
Disk Becomes Tape



Tape is Dead
Disk is Tape
Flash is Disk
RAM Locality is King

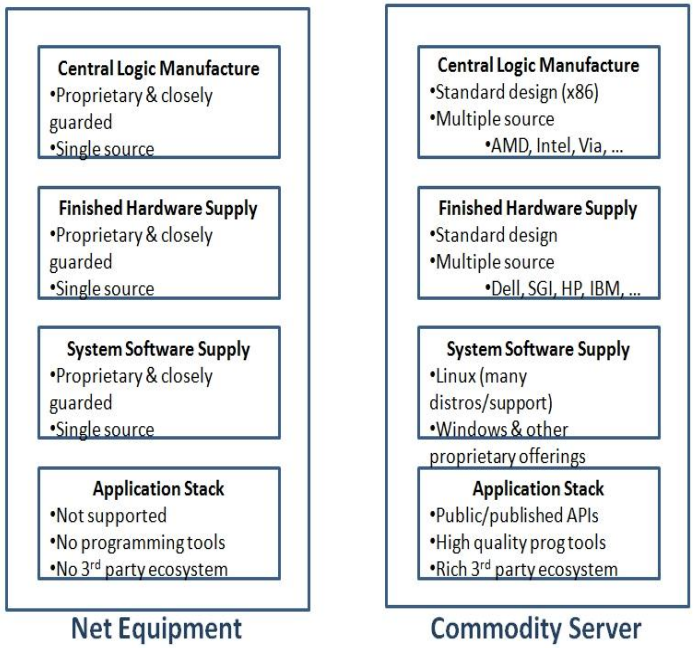
Jim Gray
Microsoft
December 2006

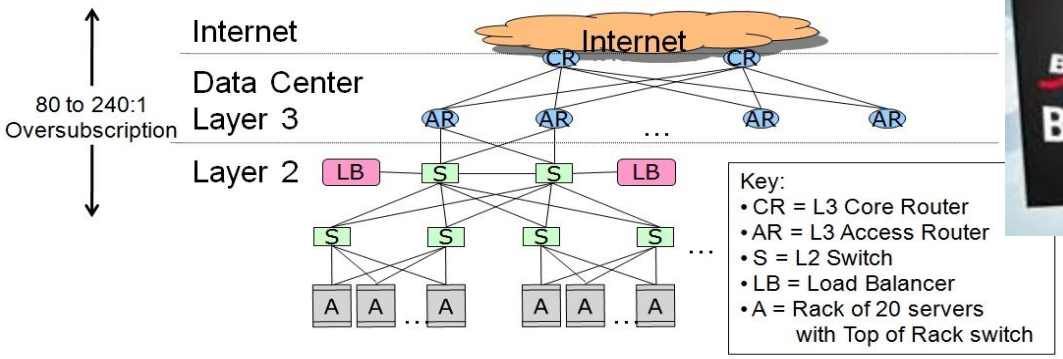
- Disk random access B/W growth ~10% of sequential B/W
- Random read 3TB disk: 31 days @ 140 IOPS (8kb)
  - 8.3 hours sequentially
- Storage Chasm widening
  - Disk becomes tape and flash becomes disk

Source: Dave Patterson with James Hamilton updates

Sea Change in Networking

- Current networks over-subscribed
  - Forces workload placement restrictions
  - Goal: all points in datacenter equidistant
- Mainframe model goes commodity
  - Competition at each layer over vertical integ.
- Get onto networking on Moores Law path
  - ASIC port count growth at near constant cost
  - Competition: Broadcom, Marvell, Fulcrum,…





amazon web services

Networking Looking Forward

- Move to commodity routing:
  - Much less expensive & lower power
  - More redundancy & bandwidth
  - Get on Moore's law Path (ASIC port count growth)
- Centralized control plane
  - OpenFlow/Software Defined Networking
- Client side:
  - Virtualized NIC: Avoid hypervisor tax
  - ROCEE & iWarp: Avoid O/S transition
  - Cut-through routing: Avoid store and forward delay
  - B/W increases continue: 10GigE commodity

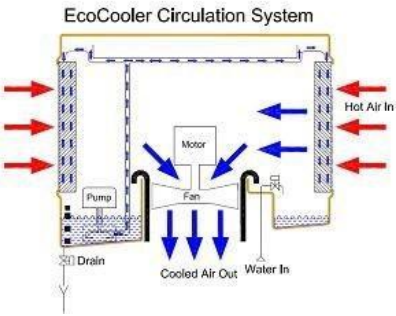
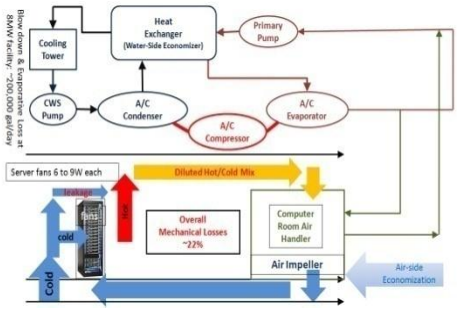
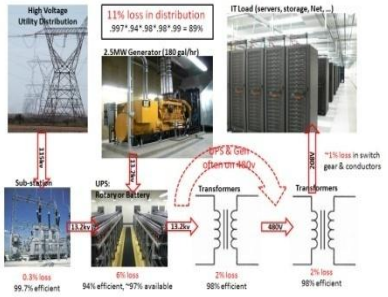
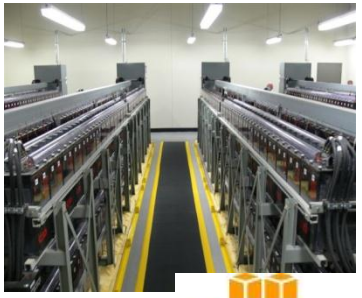
Agenda

- Cloud & Accelerating Pace of Innovation
- Technology Changes
  - Memory wall & Storage Chasm
  - Disk is Tape
  - Sea Change in Networking
- Data & Storage Trends
  - Map Reduce & NoSQL
  - Migration to Cloud



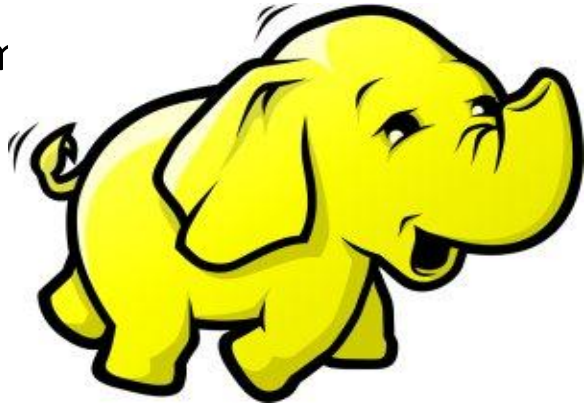




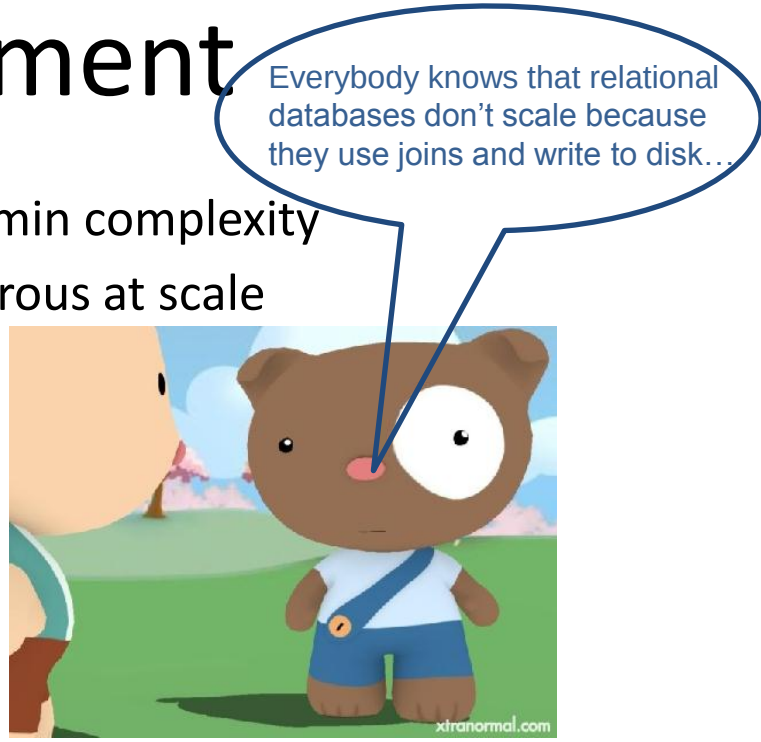


MapReduce

- Reaction to “RDBMs don’t scale” & admin costs
  - System community solution to big data problem
- MapReduce success fueled by:
  - Exploding data sizes
  - Scales (4,000 node single cluster at Yahoo)
  - Declining cost of computing
  - Sequential access pattern coupled with brute force
- MapReduce great for:
  - Extract, Transform and Load
  - Dirty data, weak schema, & access patterns not well suited to indexes
  - Executing arbitrary or complex functions over all data
- MR re-implementing indexes, materialized views, hash join, pipelined operators, …



NoSQL Movement



- Another reaction "RDBMS don't scale" & admin complexity
- Unpredictable RDBMS response times dangerous at scale
- Relax a subset of ACID to achieve scale:
  - Eventually consistent
  - Non-durable on commit
  - Don't fully isolate conflicting txns
  - Don't support multi-item atomic update
  - Light to no schema enforcement
  - No complex query, no joins, no aggregates, no RI, no…
- Simple programming model and administration
  - Eventual consistency often not "really" understood
  - App code required for complex queries
- Good for some workloads at scale:
  - Cassandra, MongoDB, CouchDB, SimpleDB, …

amazon web services™

Client Storage Migration to Cloud

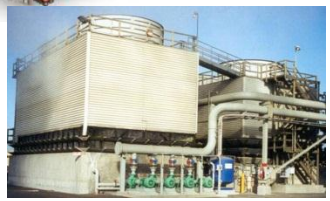
- Client disk rapidly replaced by local semiconductor caches
  - Flash becoming primary client storage media
  - Higher performance, Lower power, smaller form factor, greater shock resistance, scale down below HDD cost floor, greater humidity range, wider temp range, lower service costs, …
- Same trend in embedded devices
  - Well connected with cloud-hosted storage
- Clients storage drives cloud storage
  - Value added services, many data copies, shared access, indexed, classified, analyzed, monetized, reported, …

amazon web services

Open Source & Cloud Influence

- Open Source DBs inexpensive
  - Encourages sharding rather than scale-up
- Cloud removes DB admin cost
  - Further fueling increased used of sharding
- DBs Ideal workload for the cloud:
  - DB admin is hard but at scale it can be automated
  - Admin scales up well & down poorly
- Massive amount of data in cloud
  - Bring the query to data rather than data to query

Summary



- Cloud scale driving quickening pace of innovation
- Plunging costs driving bigger data sets and more complex analysis
  - Data moving up memory hierarchy
  - Data moving up the storage hierarchy
- Networking costs & capabilities changing fundamentally
- Most difficult scaling problems always data related
- Exciting time to be in the storage world
